The vertical screw conveyor of a Siwertell ship unloader is divided into sections of approximately five metres long each. On the back of this sheet is detailed information of how it fits together and what the benefits are of it.
**Description**

The sections are connected by a short shaft bolted to the screw sections. Around the shaft there is a short piece of screw longitudinally split into two halves. These halves are then clamped around the shaft by bolts.

On the outer edge there are tungsten carbide inserts soldered to the screw flight edge. The OD-bearing house has four openings with covers. The covers are adjustable by shims and act as a bearing surface towards the bearing screw.

**Benefits**

This type of circumference bearing gives a continuous screw flight from bottom to top without any interruptions, and the risk of material getting stuck is minimised.

It also gives a lower energy consumption and there is less risk for damages caused by tramp material compared with the standard inner diameter bearing holders. The wear on the transport screw flight edges is also considerably lower. The result is an overall increased lifetime.

**Scope of supply**

- OD-shaft
- OD-screw section (2 halves)
- bolts
- OD-covers
- shims for cover adjustment
- OD-bearing house

**Bots for connection of OD/bearing screw halves.**

**Transport screw section**

**OD bearing screw section**

**Tungsten carbide inserts**

**Inside the OD bearing house**

**OD bearing house with removed covers**

**Adjustable OD-bearing covers**
